

## Mini Cooper Makes and Models

Time to put it all together! Use everything we've covered so far - SASS, Vue, AJAX, databases and Fetch to create a dynamic one-page app based on our class build. Click on one of the Mini models to show more content / data about that model. You will be navigating around in your app using Vue lifecycle hooks, components, and AJAX where appropriate.

### What the app does:

- Show 3 car models as thumbnails
- Click on the thumbnails, each car's information will pop up, showing the model's name, price and description.
- Click on the thumbnails again and the information will disappear

### Solutions:

- Use Vue Component to manipulate the UI, showing each car's information by getting their id
- Use AJAX Fetch to get the data from database

### Considerations:

- Be careful with the props name, component name and function name or else the function will break if the names are called wrong
- Syntax must be correct
- Sometimes Vue does not update when there are changes input
